Claim 1; Page 14; 225pp; English.

an The sequence encodes S. aureus MurC (UDP-N-acetylmuramate:L-alanine ligase). The polymucleotides of the invention are used to detect Staphylococcus undeled acids in a blological sample from an animal for diagnosing Staphylococcus infections. The polypeptides of the invention are used to detect anti-Staphylococcus antibodies in a biological sample from an animal to diagnose Staphylococcus infections. The polypeptides are also used in vaccines to elicit protective antibodies in an animal to infection caused by a member of the Staphylococcus genus and for preventing or attenuating an infection, cellulitis, burn infection, eyelid infection, food poisoning, sinfection, neonatal conjunctivitis, osteomyelitis, skin infection, scalded skin syndrome (also known as toxic epidermal necrosis, Ritter's

ö
disease and Lyell's disease), toxic shock syndrome and endocarditis. The polymucleotides may also be used in vaccines and for preventing or attenuating a Staphylococcus infection. Antibodies to the polypeptides may be used to purify, detect and target the polypeptides in in vitro and in vivo diagnostic and therapeutic methods
                                                                                                                                                                                                                                                                                                                                                                                                                  180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 360

Novel crystallized recombinant polypeptides from Staphylococcus aureus, Streptococcus pneumoniae and Escherichia coli and which are involved in membrane biosynthesis, useful as targets for pathogenic bacteria.

Claim 20; SEQ ID NO 27; 325pp; English

This invention relates to the structural and functional characterisation of microbial polypeptides from Staphylococcus aureus (S. aureus), Streptococcus pneumoniae (S. pneumoniae) and Escherichia coli (B. coli) that provide novel antimicrobial targets. Specifically, it refers to that provide novel antimicrobial targets. Specifically, it refers to polypeptides that are involved in membrane biosyntheeis, which play a critical role in the life cycle and viability of their pathogenic species of origin, and hence provide valuable drug targets. Furthermore, the invention describes modified version of these proteins that facilitate characterisation by labelling with isotopic or heavy atoms, and also characterisation by labelling with isotopic or heavy atoms, and also information to aid the discovery of therapeutic molecules to treat disorders associated with a particular pathogenic species. As such, they care useful for inducing an immunological response in an individual and as an antigen for vaccination purposes. The polypeptides are also useful for developing antimicrobial agents for use as surface disinfectants, personal hygiene applications and as food preservatives or in treating food products to eliminate potential pathogens. This polymucleotide sequence is DNA predicted from the genomic sequence of S. aureus UDP-N-sectylmuramate-alamine ligase (murc) of the invention.

                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                           The invention relates to novel genes and encoded proteins from Staphylococcus aureus. A composition comprising the S. aureus protein, a nucleic acid encoding the protein, or an antibody to the protein, is useful as a paramaceutical, particularly as a vaccine for treating or preventing infection due to Staphylococcus bacteria, specifically an infection caused by S. aureus. The composition is particularly useful for treating or preventing sepsis in a patient. The composition can also be used for diagnostics. The protein is also used in an assay for enzymatic studies and as a target for antibiotics. This sequence represents one of the novel S. aureus genes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                               180

WPI; 2003-468119/44. P-PSDB; ADD15465. Novel crystallized recombinant polypeptides from Staphylococcus aureus, Streptococcus pneumoniae and Escherichia coli and which are involved in membrane biosynthesis, useful as targets for pathogenic bacteria.

Claim 20; SEQ ID NO 29; 325pp; English

This invention relates to the structural and functional characterisation of microbial polypeptides from Staphylococcus aureus (S. aureus), Streptococcus premoniae (S. preumoniae) and Escherichia coli (E. coli) that provide novel antimicrobial targets. Specifically, it refers to polypeptides that are involved in membrane biosynthesis, which play a critical role in the life cycle and viability of their pathogenic species of origin, and hence provide valuable drug targets. Furthermore, the invention describes modified version of these proteins that facilitate characterisation by labelling with isotopic or heavy atoms, and also characterisation by labelling with isotopic or heavy atoms, and also information to aid the discovery of therapeutic molecules to treat disorders associated with a particular pathogenic species. As such, they are useful for inducing an immunological response in an individual and as an antigen for vaccination purposes. The polypeptides are also useful for devaloping antimicrobial agents for use as surface disinfectants, personal hygiene applications and as food preservatives or in treating conducts to eliminate potential pathogens. This polymucleotide sequence is the experimentally predicted DNA of S. aureus UDP-N-acetylmuramate-alanine ligase (murc) of the invention.

New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.

Claim 14; SEQ ID NO 7596; 1766pp; English.

the invention fraints to am instance acts comprising any one or the invention fraints to am its invention fraints to an interaction of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid conding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated continued for proliferation or the activity of a gene in an operon required for proliferation; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for that has an activity against a biological pathway in which a proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent or which each of the strains is present in a culture or collection of strains; or (13) identifying proteins or screening for homologous nucleic acids are useful for clantifying proteins or screening for homologous nucleic acids required for interaction and organism. The antisense modeled acids required for clandidate modeled acids are useful for clandidate and descreen and acids are useful for clandidate and all and provery more are not for generalized modeled acids are useful for clandidate and all and provery more are not for erreaning and when a provery more and a provery more and acids are useful for an area of the strains or for erreaning and acids are useful for an area of the strains and and an area of the acids required for a provery more an organism. drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at five wipo.int/pub/published_pct_sequences one of invention relates to an isolated nucleic acid comprising any

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       8
```

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of movel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia soli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonaa earuginosa and Entercoccus faecalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins eantibodies compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous

Claim 27; SEQ ID NO 8195; 511pp; English.

οĘ polynucleotides for the identification and development antibiotics, comprise sequences of antisense nucleic acids

SEQ ID NO 4242; 511pp; English Claim

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes,

their use in the discovery of novel antibiotics, the essential genes
themselves and the encoded proteins. The prokaryotes used are Escherichia
coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae,
Pseudomonas aeruginosa and Esterococcus faccalis. The invention is also
useful for the identification of potential new targets for antibiotic
development. The antisense nucleic acids can also be used to identify
proteins used in proliferation, to express these proteins, and to obtain
antibodies capable of binding to the expressed proteins. The proteins can
cantisense nucleic acids sequence is also useful to screen for nomologous
nucleic acids which are required for cell proliferation in a wide variety
of organisms. The present sequence encodes an essential prokaryotic
collular proliferation protein. Note: The sequence data for this patent
did not form part of the printed specification, but was obtained in
electronic format directly from WIPO at

```
The present sequence represents a MurC gene encoding a Staphylococcus aureus UDP-N-acetylmuramate:L-alanine ligase (MurC polypeptide). Host cell contraining an expression system comprising the MurC gene can be used for the recombinant production of the polypeptide. Agonists or the MurC polypeptide are used to treat conditions requiring increased activity or expression of the polypeptide. Antagonists, inhibitory nucleic acid or competitive polypeptide are useful for inhibiting the polypeptide e.g. bacterial (especially S. aureus) infections. They are also useful against Helicobacter pylori infections and related cancers, ulcers and gastritis. The antibacterial agents are useful to treat in-dwelling devices for infection prevention or generally as wound treatments to prevent adhesion of bacteria to matrix proteins. The MurC polypeptide is also useful for diagnosing or prognosing a (susceptibility to) disease, for raising attibodies, to identify modulators or specific receptors; in rational drug design and as an immunogen for vaccines. The MurC gene sequences are useful in antisense/ribozyme therapeutics; to detect mutant MurC gene; increment in antisense/ribozyme therapeutics; to detect mutant MurC gene; increments in the contrained in antisense in the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             180

This sequence represents one of 5191 Staphylococcus aureus DNA sequences of the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access medium, preferably selected from a floppy or hard disk, random access memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using the S.aureus DNA sequences allows putative functions to be assigned so industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can lake be used in a kit for the immunodetection of S.aureus in a sample. S.aureus is implicated in numerous human diseases, including cellulitis, eyelid infections, scalded skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences can be used the meaning are useful as primers or probes for isolating headable meading.

The invention relates to a UDD-N-acetylmuramate:L-alanine ligase (Murc polypeptide) encoded by the S. aureus Murc gene. Host cells containing an expression system comprising the Murc gene can be used for the ceppression system comparising the Murc gene can be used for the comparising the polypeptide. Againsts or the Murc polypeptide are used to treat conditions requiring increased activity or competitive polypeptide. Antagonists, inhibitory nucleic acid or competitive polypeptide are useful for inhibiting the polypeptide acid or competitive polypeptide are useful for infections. They are also useful against the antibacterial agains and related cancers, ulcers and gastritis. The antibacterial agains are useful to treat in-dwelling devices for infection prevention or generally as wound treatments to prevent adhesion of bacteria to matrix proteins. The Murc polypeptide is also useful for of bacteria to matrix proteins. The Murc polypeptide is also useful for antibodies; to identify modulators or specific receptors; in rational custing dealing and as an immunogen for vaccines. The Murc gene sequences are to chromosomal mapping; to determine bacterial serotype; and for genetic 1801 GIGCATCGITAAITAAIGAAGATICTATIAAIGAIGTATAGAACAAITIGAIAAIGCIGITA 1860 1861 TITIATITATGGGGGGGGGATATTCAAAATTACAAAATGCATATTTAGATAAATTAG 1920 New isolated MurC polypeptide from Staphylococcus aureus and related nucleic acid - useful in diagnosis, treatment and prevention of bacterial GTGCATCGTTAATTAATGAAGATTCTATTAATGTATTAGAACAATTTGATAATGCTGTTA TTTTATTTATGGGTGCAGGTGATATTCAAAAATTACAAAATGCATATTTAGATAAATTAG Murc gene; UDP-N-acetylmuramate:L-alanine ligase; Murc polypeptide; bacterial; infection; H. pylori; cancer; ulcer; gastritis; vaccine; immunogen; drug; genetic immunisation; ds. /*tag= a /product= "partial MurC polypeptide" Partial nucleotide sequence of the Murc gene. ```
function, and represents a DRA Sequence of the invention. The DNA sequences were isolated from Staphylococcus aureus WGHU29 (NCIMB 40711). Host cells containing the DNA sequences are used to produce polypeptides or fragments. The proteins are used in the treatment of disease, for inducing an immune response by administering them, to produce antibody and/or T-cell immune response. Antagonists of the proteins are used for the inhibition of bacterial polypeptides. Conditions which may be treated include bacterial infections, especially respiratory, cardiac, particulated, central nervous, eye, kidney, uninary tract, skin, bones and joints. The proteins can also be used to identify antimicrobial compounds which are broad spectrum antibiotics, especially useful in the treatment of H. pylori infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, the discovery of novel antibiotics, the essential genes their use in the discovery of novel antibiotics, the essential genes to their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus arengoneal are Escherichia coli, Staphylococcus and Enterococcus faecalis. The invention is also useful for the identification of potential new targets for antibiotic cavidates apple of binding to the expresse these proteins, and to obtain the proteins used in proliferation, to expresse these proteins, and to obtain the bensed to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence is an antisense oligonucleotide of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly the man will be the printed specification, but was obtained in electronic format directly the printed specification, but was obtained in electronic format directly are the printed specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ô

The invention relates to an isolated nucleic acid comprising any one of
the 6213 antisense sequences given in the specification where expression
of the nucleic acid inhibits proliferation of a cell. Also included are:
(1) a vector comprising a promoter operably linked to the nucleic acid
encoding a polypeptide whose expression is inhibited by the antisense
nucleic acid; (2) a host cell containing the vector; (3) an isolated
contisense nucleic acid; (4) an antibody capable of specifically binding
the polypeptide or its fragment whose expression is inhibited by the
antisense nucleic acid; (4) an antibody capable of specifically binding
the polypeptide or its fragment whose expression is inhibited by the
cut isolypeptide or its fragment whose expression is inhibited procut proliferation or the activity of a gene in an operon required for
proliferation or the activity of a gainst a biological pathway
control for proliferation, or that inhibits cellular proliferation; (8)
identifying a gene required for cellular proliferation of an
compound's activity; (1) a culture comprising strains in which the proliferation-required gene or its gene

ö New polynucleotides for the identification and development antibiotics, comprise sequences of antisense nucleic acids.

Claim 1; SEQ ID NO 1599; 511pp; English.

the 6213

patent did not form part of the printed specification, but was obtained K. pneumoniae or P. aeruginosa. The present sequence is one of the 621: antisense sequences of the invention. Note: The sequence data for this

in electronic format directly from WIPO at the out of the contract of the cont

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Miebsiella pneumoniae, Pseudomonas aeruginosa and Enerococcus faecalls. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous

themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonalla typhi, Klebsiella pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acids sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence is an antisense oligonucleotide of the invention. Note: The sequence data for this patent did not form part of from WIPO at ftp.wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    418

Claim 1; Page 14; 225pp; English.

The sequence encodes S. aureus MurC (UDP-N-acetylmuramate:L-alanine ligase). The polynucleotides of the invention are used to detect

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Staphylococcus nucleic acids in a biological sample from an animal for diagnosing Staphylococcus infections. The polypeptides of the invention are used to detect anti-Staphylococcus infections. The polypeptides from an animal to diagnose Staphylococcus infections. The polypeptides are also used in vaccines to elicit protective antibodies in an animal to a member of the Staphylococcus genus and for preventing or attenuating an infection caused by a member of the Staphylococcus genus e.g wound infection caused by a member of the Staphylococcus genus e.g wound infection, cellulitis, burn infection, eyelid infection, food poisoning, coint infection, neonatal conjunctivitis, osteomyelitis, skin infection, scalded skin syndrome (also known as toxic epidermal necrosis, Ritter's disease and Lyell's disease), toxic shock syndrome and endocarditis. The polymoclocides may also be used in vaccines and for preventing or attenuating a Staphylococcus infection. Antibodies to the polypeptides may be used to purify, detect and target the polypeptides in in vitro and therapeutic methods

This invention relates to the structural and functional characterisation of microbial polypeptides from Staphylococcus aureus (S. aureus), Streptococcus preumoniae (S. pneumoniae) and Sacherichia coli (E. coli) that provide novel antimicrobial targets. Specifically, it refers to critical role in the life cycle and viability of their pathogenic species of critical role in the life cycle and viability of their pathogenic species of origin, and hence provide valuable drug targets. Furthermore, the invention describes modified version of these proteins that facilitate characterisation by labelling with isotopic or heavy atoms, and also fusion proteins. These proteins provide structural and functional information to aid the discovery of therapeutic molecules to treat disorders associated with a particular pathogenic species. As such, they are useful for inducing an immunological response in an individual and as a natigen for vaccination purposes. The polypeptides are also useful for develophing antimicrobial agents for use as surface disinfectants, personal hygiene applications and as food preservatives or in treating for sequence is DNA predicted from the genomic sequence of S. aureus UDP-Nacetylmuramate-alanine ligase (murC) of the invention.

```

This invention relates to the structural and functional characterisation of microbial polypeptides from Staphylococcus aureus (S. aureus), Streptococcus preumoniae (S. pneumoniae) and Sacherichia coli (B. coli) that provide novel antimicrobial targets 'Specifically, it refers to polypeptides that are involved in membrane biosynthesis, which play a critical role in the life cycle and viability of their pathogenic species of origin, and hence provide valuable drug targets. Furthermore, the invention describes modified version of these proteins that facilitate invention describes modified version of these proteins that facilitate information to aid the discovery of therapoutic molecules to treat disorders associated with a particular pathogenic species. As such, they are useful for inducing an immunological response in an individual and as an antigen for vaccination purposes. The polypeptides are also useful for developing antimicrobial agents for use as surface disinfectants, an antigen for vaccination purposes. The polypeptides are also useful for personal hygiene applications and as food preservatives or in treating food products to eliminate potential pathogens. This polynucleotide sequence is the experimentally pradicted DNA of S. aureus UDP-N-Novel crystallized recombinant polypeptides from Staphylococcus aureus, Streptococcus pneumoniae and Escherichia coli and which are involved in membrane biosynthesis, useful as targets for pathogenic bacteria.

A composition comprising the S. aureus protein, a nucleic acid encoding the protein, or an antibody to the protein, is useful as a pharmaceutical, particularly as a vaccine for treating or preventing infection due to Staphylococcus bacteria, specifically an infection caused by S. aureus. The composition is particularly useful for treating or preventing sepsis in a patient. The composition can also be used for diagnostics. The protein is also used in an assay for enzymatic studies and as a target for antibiotics. This sequence represents one of

the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated or nucleic acid; (3) a most cell containing the vector; (3) an isolated or polypeptide or its fragment whose expression is inhibited by the artisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of agene in an operon required for proliferation, (7) identifying a compound that influences the activity of required for proliferation, (6) identifying a gene required for cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profilling a compound, sactivity; (11) a culture comprising strains in which the gene or which he set or compound the activity is overspressed or underexpressed; (12) determining the extent or which he are in a companiant. to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids The invention relates to an isolated nucleic acid comprising any one

```

their use in the discovery of novel antibiotics, the essential genes
themselves and the encoded proteins. The prokaryotes used are Escherichia
oil, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae,
Pseudomonas aeruginosa and Enterococcus facealis. The invention is also
useful for the identification of potential new targets for antibiotic
development. The antisense mucleic acids can also be used to identify
proteins used in proliferation, to express these proteins, and to obtain
antibodies capable of binding to the expressed proteins. The proteins can
entisense nucleic acids sequence is also useful to screen for homologous
nucleic acids which are required for cell proliferation in a wide variety
of organisms. The present sequence encodes an essential prokaryotic
collular proliferation protein. Note: The sequence data for this patent
did not form part of the printed appecification, but was obtained in
electronic format directly from WIPO at

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of movel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Seudomonas aeruginosa and Enterococcus faccalls. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The proteins can be used to screen compounds in rational drug discovery programmes. The nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence encodes an essential prokaryotic cellular proliferation protein. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in clectronic format directly from WIPO at the wipo int/pub/published_pct_sequences

```
The present sequence represents a MurC gene encoding a Staphylococcus aureus UDP-N-acetylmuramate:L-alanine ligase (MurC polypeptide). Host cell containing an expression system comprising the MurC gene can be used for the recombinant production of the polypeptide. Agonists or the MurC polypeptide are used to treat conditions requiring increased activity or expression of the polypeptide. Antagonists, inhibitory nucleic acid or competitive polypeptide are useful for inhibiting the polypeptide e.g. bacterial (sepecially S. aureus) infections. They are also useful against Helicobacter pylori infections and related cancers, ulcers and gastritis. The antibacterial agents are useful to treat in-dwelling devices for infection prevention or generally as wound treatments to prevent adhesion of bacteria to matrix proteins. The MurC polypeptide is also useful for diagnosing or prognosing a (susceptibility to) disease, for raising aruthodies; to identify modulators or specific receptors; in rational drug design and as an immunogen for vaccines. The MurC gene sequences are useful in antisense/riboxyme therapeutics; to detect mutant MurC gene; for chromosomal mapping; to determine bacterial serotype; and for genetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             TATACTICAGIAGCIGIAACIGGIGCACAIGGIAAAACTICIACAACAGGIITAATATCA 360

This sequence represents one of 5191 Staphylococcus aureus DNA sequences of the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using the S.aureus DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can be used in a vaccine composition against S.aureus infection. The colypeptides can also be used in a kit for the immunodetection of S.aureus in a sample. S.aureus is implicated in numerous human diseases, including cellulitis, eyelid infections, food poisoning, osteomyelitis, skin and surgical wound infections, scalded skin syndrome, toxic shock of for recombinant production of the polypeptides. The new DNA sequences can be used to the including cellulities are useful as primers or probes for isolating computer and their fragments) are useful as primers or probes for isolating to a computer and the computer are alsolating contained on the computer and the computer and the computer are contained on the computer and the computer

ABN90538 to ABN93374 represent Staphylococcus epidermidis open reading frame (ORF) nucleic acid sequences which encode the amino acid sequences given in ABP35124 to ABP37960. The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to screen for compounds able to interfere with the S. epidermidis life cycle or inhibit S. epidermidis infection. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the USPTO web site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           135

the inventor relates to an interest and compilating any order the following any transfer the following any transfer the following any transfer the following a product operably linked to the mucleic acid encoding a polypeptide whose expression is inhibited by the antisense mucleic acid, (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense mucleic acid; (4) an antibody capable of specifically binding attisense mucleic acid; (4) an antibody capable of specifically binding colliferation or the activity of agence in an operon required for proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits proliferation of the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the extent or organism acts; (9) manufacturing an antibiotic; (10) profiling a product is overexpressed or underexpressed; (12) determining the extent or owhich each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. preumoniae or P. aeruginosa. The present sequence is one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at screening Zyskind JW; Xu HH; S New antisense nucleic acids, useful for identifying proteins or s for homologous nucleic acids required for cellular proliferation isolate candidate molecules for rational drug discovery programs. ds; prokaryotic essential gene; cell proliferation; invention relates to an isolated nucleic acid comprising Ohlsen KL, Forsyth RA, Haselbeck R, Yamamoto R, Claim 14; SEQ ID NO 34994; 1766pp; English. ftp.wipo.int/pub/published_pct_sequences Prokaryotic essential gene #28781 Malone C, Carr GJ, 21-MAR-2001; 2001US-00815242. 06-SEP-2001; 2001US-00948993. 25-OCT-2001; 2001US-0342923P. 08-FEB-2002; 2002US-00072851. 06-MAR-2002; 2002US-0362699P 21-MAR-2002; 2002WO-US009107 Staphylococcus epidermidis (first entry) (ELIT-) ELITRA PHARM INC. The invention relates to a UDP-N-acetylmuramate:L-alanine ligase (MurC polypeptide) encoded by the S. aureus MurC gene. Host cells containing an expression system comprising the MurC gene can be used for the recombinant production of the polypeptide. Agonists nor the MurC polypeptide are used to treat conditions requiring increased activity or expression of the polypeptide. Antagonists, inhibitory nucleic acid or competitive polypeptide are useful for inhibiting the polypeptide e.g. bacterial (especially S. aureus) infections. They are also useful against Helicobacter pylori infections and related cancers, ulcers and gastritis. The antibacterial agents are useful to treat in-dwelling devices for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          MurC polypeptide from Staphylococcus aureus and related - useful in diagnosis, treatment and prevention of bacterial

                  of bacteria to matrix proteins. The Murc polypeptide is also useful for diagnosing or prognosing a (susceptibility to) disease, for raising antibodies; to identify wodulators or specific receptors; in rational drug design and as an immunogen for vaccines. The Murc gene sequences are useful in antisense/ribozyme therapeutics; to detect mutant Murc gene; immunisation. The present sequence represents a partial nucleotide sequence (Murc ORF) of the Murc gene
  infection prevention or generally as wound treatments to prevent adhesion

The invention relates to an isolated nucleic acid compilating a promoter of the mucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid enodding a promoter operably linked to the nucleic acid enodding a promoter operably linked to the nucleic acid comprising a promoter operably linked by the antisense and polypeptide whose expression is inhibited by the antisense outleic acid; (2) a host cell containing the vector; (3) an isolated of antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular contisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway in which a proliferation or that inhibits cellular proliferation of the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiocit; (10) profilling a compound; activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent of the strains is present in a culture or collection of an organism. The antisense nucleic acids are useful for estrains; or (13) identifying the target of a compound that inhibits the control of an organism. The antisense nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, contradicate dor proliferation in cells other than S. aureus, S. typhimurium, contradicate dor proliferation in cells other than S. aureus, S. typhimurium, contradicate of the printed specification, but was obtained in all and the present sequence dor this patent did contradication of the present sequence are one of the target.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           61 ATGCATGATTTAGGACATGAAGTTCAAGGATCGGATATTGAGAACTACGTATTTACAGAA 120

The DNA sequences were isolated from Staphylococcus aureus WCHU29 (NCIMB 40771). Host cells containing the DNA sequences are used to produce polypeptides or fragments. The proteins are used in the treatment of disease, for inducing an immune response by administering them, to produce antibody and/or T-cell immune response. Antagonists so f the proteins are used for the inhibition of bacterial polypeptides. Conditions which may be treated include bacterial infections, especially respiratory, cardiac, gastrointestinal, central nervous, eye, kidney, urinary tract, skin, bones and joints. The proteins can also be used to identify antimicrobial compounds which are broad spectrum antibiotics, especially useful in the treatment of H. pylori infection
                                                                                                                                                                                                                                                                                                                      Staphylococcus aureus protein; immune response induction; eye infection; antibody production; T-cell immune response; gastrointestinal infection; respiratory infection; inhibitor; bacterial infection; centiac infection; central nervous system; kidney infection; urinary tract infection; antimicrobial compound identification; broad spectrum antibiotic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New nucleic acid sequences from Staphylococcus aureus WCHU29 - useful :
vaccines and for treatment of bacterial infections of e.g. respiratory

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of movel antibiotics, the essential genes their use in the discovery of movel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia chambelves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas acruginosa and Enterococcus faccalias. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain attibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The autisense nucleic acids sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence encodes an essential prokaryotic cellular proliferation protein. Note: The sequence data for this patent cit form part of the printed specification, but was obtained in electronic format directly from WIDO at electron
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            58 raccarrirdressarraaaserrerescareaserrearraseserresrerraciona 117
